ABSTRACT

This program, funded by the State of Michigan, was designed to provide compensatory education in basic reading and arithmetic skills for elementary school children with serious deficiencies in these areas. The composite achievement scores of the 1970-71 Michigan Educational Assessment Program were used to establish eligible school districts. Minimum performance objectives of at least one month's gain in achievement for each month of instruction as measured by approved pre- and posttest instruments were established for each student in the program. In order for each school district to receive the full allocation per pupil of \$200, each student must achieve 75 percent of the specified objectives. Funds were allocated to those districts with the highest concentration of students achieving at the 15th percentile or below--112,500 children in 740 schools in 67 districts--and were used for payment of salaries for qualified teachers, aides, counselors, social workers, for educational materials and equipment, and for special training for teachers and other staff members. The program's objectives of increasing basic skills in reading and arithmetic were realized such that a large percentage of students who previously had performed below average can perform at an average or above average pace when programs are designed to meet their needs. FOREWORD

We are pleased to present Report Number 2, the second of two reports providing a description and evaluation of the 1971-72 Section 3 compensatory education programs in Michigan.

This document is intended to provide legislators, educators and citizens with information regarding the 1971-72 Section 3 programs.

This report has been prepared by Dr. Maureen A. Sie; questions or requests for additional information relative to the data contained in this report may be directed to her at Research, Evaluation and Assessment Services, Michigan Department of Education.

John W. Porter
Superintendent
of
Public Instruction

ACKNOWLEDGEMENTS

All large projects require cooperative efforts, there are many individuals who contributed to the completion of this evaluation project. It is doubtful that this report could have been written without the cooperation of students, teachers and administrators of the 67 Section 3 school districts.

Dr. Howard Teitelbaum provided assistance in using the Michigan State University's statistical packages and its computer facilities for the analysis of Section 3 data. Mr. Steve Peter, Mr. Michael Tsai and Mr. Paul Canfield worked with the writer throughout the year to set up procedures for a student record keeping system as well as the maintenance, auditing and programs for the analyses of data.

Ms. Nancy Schoewe Heyser helped with the writing of the section on high and low achieving school districts and the preparation of tables, Ms. Ronnie Kurchner worked on the financial reports and Mr. John Orehovec prepared the graphs. They also worked jointly on updating the master file of the student records. Ms. Phyllis Wilson, Ms. Alice Vanneste and Ms. Chris Kilmer typed the manuscript.

The writer is also indebted to Prof. Robert Ebel, Prof. Fred Ignatovich, Prof. Mary Ellen McSweeney, Prof. Andrew Porter and Dr. Howard Teitelbaum of Michigan State University for their enlightened discussion on some issues concerning measurement and evaluation. The writer in no way implies that these persons are responsible for the contents of the report.

And finally, special thanks should be given to Dr. David Donovan, Director of Research, Evaluation and Assessment Services for his administrative support during the past year.

OVERVIEW

"The first results from Michigan's \$22.5 million 'accountability model' for compensatory education appear to dispute the contention that these programs cannot succeed. Under the state-funded 'comp. ed.' program, schools establish performance objectives, representing at least one grade level gain, for participating students. The program now reaches 112,000 elementary school children who rank in the bottom 15th percentile in math and reading in 67 school districts. In order for the school district to receive a full \$200 per pupil grant in subsequent years, each student must achieve at least 75 percent of the specified objectives."

Education USA, December 18, 1972

The Michigan state legislature appropriated \$22,500,000 for compensatory education during the 1971-72 school year under Section 3 of the State School Aid Act. The money was to be used to improve the reading and arithmetic skills of children with serious deficiencies in these areas and could not be used to supplant local expenditures.

The composite achievement scores of the 1970-71 Michigan Educational Assessment Program were used to establish eligible school districts. Money was allocated to districts at the rate of \$200 per eligible pupil beginning with the district that had the highest concentration of students achieving at the 15th percentile or below on the assessment tests. This procedure was followed until all available funds were spent. There was sufficient money to cover 112,500 children in 740 schools in 67 districts.

There were two questions to be tested in the state's compensatory education program: 1) Can school districts be held accountable for educating the lowest-achieving pupils in their schools? and 2) Will the injection of additional funds for compensatory education improve the basic skills of low-achieving pupils?

Basically, the Section 3 program is a three-year performance contract between the school district and the state. Each of the eligible 67 school districts had to submit a proposal describing its goals, objectives and instructional processes. Minimum accomplishment objectives -- at least a month's gain for every month of instruction -- were established as performance objectives for each student in the program.

For each pupil achieving 75 percent of the accomplishment level, the school district would receive a full allocation per pupil for the following fiscal year. For each pupil achieving less than 75 percent of the accomplishment level, the district would receive an amount proportional to the gains attained.

Because of the late implementation of the compensatory education program -- it was funded in October of 1971 -- the Legislature authorized a one-year waiver of fiscal accountability, and thus there will be no penalty in 1972-73, for children achieving less than 75 percent of the accomplishment level during the 1971-72 school year.

The State Board of Education expected that basic skills programs would be designed to meet the particular educational needs of the children to be served. Imaginative thinking and new approaches in the design of reading and arithmetic programs were encouraged.

Some of the ways that Section 3 funds were to be used included the payment of salaries for qualified teachers, aides, counselors, social workers, and other staff members when they were added to the regular staff to improve the educational program for the Section 3 students. School districts might also purchase additional educational materials and equipment. Schools might offer special training for teachers, aides and other staff members. The

actual expenditures did not differ radically from these suppositions (see the Tables in the body of the report for details).

Section 3 rules stipulate (rule 3b) that, "the district shall include in its application a commitment that its minimum performance objective shall be an increase in achievement equivalent to one year's growth as specified in the performance objectives for this program as measured by approved pre- and posttest instruments."

Tables A and B summarize student achievement.

Among the students with matched pre- and posttest scores, more than half of the students achieved at or above the 100 percent of accomplishment level, that is at least one month gain in achievement per month in the program.

Twenty-eight percent of the students achieved at or above the 200 percent accomplishment level, which can be interpreted as at least two months gain per month in the program.

Twelve percent of these students made the 300 percent of accomplishment level or above, which is to say that they gained at least 3 months per month in the program.

Sixty-six percent of the Section 3 students, for whom matched pre- and posttest scores were available, achieved the 75 percent or above accomplishment level (the level at which full funding would be continued for another year if districts had been held fiscally accountable). For example, students who participated in the Section 3 program for eight months and gained six months in achievement scores would be considered to have met the 75 percent accomplishment level.

Assuming that, in general, normally progressive students achieve one year's growth as they advance from a lower grade to a higher grade each year, these data indicate that a large percentage of students who previously had performed

below average can perform at an average or above average pace when programs are designed to meet their needs.

It should be noted that the data contained in this report are based on the results of standardized norm-referenced achievement tests which were administered to Section 3 students by local school districts and reported to the Department of Education. Local school districts selected tests within guidelines established by the Michigan Department of Education and administration of the tests was controlled locally. Some of the problems associated with implementation and testing were discussed in A Description and Evaluation of Section 3 Programs in Michigan 1971-72, Report Number One.¹

At this time, it is not known what caused the significant improvement in achievement by some students. In order to make such a determination, further information is needed on: (1) the effectiveness of planned educational delivery systems; and (2) the relationship between costs and effectiveness of a planned delivery system. As a next step in the evaluation of compensatory education, staff of the Department are presently seeking support to develop, test and ultimately implement a procedure designed to provide such information.

1. For a more thorough discussion of this and other limitations, see A Description and Evaluation of Section 3 Programs in Michigan 1971-72, Report Number 1, pages 13-20.

TABLE A

SUMMARY OF STUDENT ACHIEVEMENT

SCHOOL DISTRICT	STATE TOTAL EXCLUDING DETROIT		DETROIT		STATE TOTAL	
	N	%	N	%	N	%
NUMBER OF SECTION 3 PUPILS	53,233		59,267		112,500

Subtotal 1-74%	17,274	18.36%
0% and below	14,673	15.60%

2. Data in this table are based on 94,083 students with matched pre- and posttest scores. Not included are: 17,913 students with missing or unreported data and 504 students who received less than 150 days of instruction.

3. Percent of Accomplishment equals 1 month gain per 1 month in the program.

PART I

DESCRIPTION OF DATA COLLECTED

For the school year 1971-72, individual pupil test results, as well as related information on instructional programs and financial expenditures from the school, were collected and analyzed to determine the outcomes of Section 3 programming. Successful programs by school buildings and by districts were identified. Information concerning pupil achievement, expenditures, funding levels, programs, program duration, etc. are discussed in this report.

In this, the second of two reports on the 1971-72 Section 3 Program, the major emphasis has been placed on the analysis and interpretation of results which comprised both educationally and statistically significant findings. The major sections of this report include: I - Description of Data Collected; II - Description of Section 3 Students Achievement in Reading and Arithmetic; III - Combined Results on Program Variables Analysis for All Section 3 School Districts - Excluding Detroit; IV - Results on Program Variables Analysis for the Detroit Public Schools; V - Comparison Study of High Achieving and Low Achieving School Districts; and VI - Discussion & Recommendations.

The total number of students funded under Section 3 for fiscal year 1971-72 was 112,500. The total count of records submitted by the 67 Section 3 school districts was 99,736, of which there were 94,083 students with matched pre- and posttest scores. Detroit Public Schools reported 45,455 students with matched pre- and posttest scores, or 77% of the total eligibles. The total number of students with matched test scores in the 66 Section 3 schools excluding Detroit was 48,628 or 91% of a total of 53,233 students funded under Section 3.

Nineteen of the 67 school districts submitted information on pupil replacements for pupils leaving the district, students attending less than 150 days of instruction, and students transferred. The total number of students reported under the aforementioned categories came to 504.

Each district submitted to the Michigan Department of Education a summary of expenditures report. These reports indicated that Section 3 expenditures in some school districts exceeded the allocated funds, and conversely, some districts underspent. Generally speaking, the discrepancies were small.

Quality of Data Collected

The problem of "regression-to-the-mean effect" was taken into account by rule 4 (1) which states that "A pretest shall be administered in each area of basic cognitive skills in which a pupil participates. The pretest scores shall not be used to determine eligibility to participate..." Thus, for school year 1971-72 Section 3 programs, test scores used for selection purposes could not be used as pretest scores.

In December 1971, audit visitations were made by the Michigan Department of Education (MDE) staff to review the selection procedures and pretest results. The results were presented in A Description and Evaluation of Section 3 Programs in Michigan 1971-72, Report Number 1.⁴ The MDE staff assisted local school district personnel in various phases of planning and implementing the Section 3 programs. In addition, management workshops and the publication and distribution of Section 3 guidelines further clarified the administrative and evaluation aspects of the program for the benefit of Section 3 school districts.

⁴This report is available from Research, Evaluation and Assessment Services, Michigan Department of Education, Lansing, Michigan.

The 1971 Michigan Educational Assessment Program scores were used as an independent check on the validity of the Section 3 pre- and posttest scores. Correlation coefficients of Section 3 reading pretest scores and assessment reading scores, Section 3 arithmetic pretest scores and assessment math scores, Section 3 reading posttest scores and assessment reading scores, and Section 3 arithmetic posttest scores and assessment math scores were computed for Section 3 fourth grade students in each school. The analysis was performed for schools in the eighteen most populous school districts including Detroit.

Section 3 school districts used, with very few exceptions, nationally normed achievement tests such as the Stanford Achievement Test, the Metropolitan Achievement Test, the California Achievement Test, Science Research Achievement Series, and the Iowa Test of Basic Skills.

The following school districts seemed consistently to have significant correlation coefficients: Benton Harbor, Albion, Jackson, Grand Rapids, Muskegon Heights, Pontiac and Detroit. The following districts have significant correlation coefficients with respect to certain school buildings in the districts: Flint, Lansing, Kalamazoo, Saginaw, Inkster, Romulus, and Wayne Westland. The following school districts have many buildings which showed insignificant correlation coefficients: Battle Creek, Beecher and Muskegon.

Further analysis was done on high achieving students, making more than 1½ years gains, and low achieving students, making less than 3 months gains, in each district. The correlation on the two groups showed that there was high correlation between pre- and posttest scores for students in grades 3 through 6 in both reading and arithmetic. Generally they were in the .80's and .90's, with some exceptions in about ten school districts, which showed correlation coefficients between .19 and .57. This in no way

is to suggest that the data collected in the ten school districts are not an accurate reflection of pupil achievement.

To summarize the preceding paragraphs, the staff of the Department and the staff of local education agencies have worked together in an attempt to gain valid data. Numerous workshops have been held, guidelines established, and technical assistance provided by Department staff.

Status of Pupil Achievement on the Pre- and Posttest

Each student's grade score (grade score is the grade equivalent minus the decimal, e.g., a grade equivalent score of 5.3 becomes a grade score of 53) was checked in an attempt to identify students who were not functioning at least one year below grade level in pretesting. The aggregate number of students by districts who were not achieving at least one year below grade level on the pretest are presented in Appendix A.

In assessing the status of pre- and posttest data of Section 3 students, only those students having grade scores for both tests were considered. Students in grades K, 1 and sometimes 2 were given readiness tests which do not yield grade scores. The grade level of each student was used as a reference point, a value "X" then was compared to the student's pretest grade score; if the pretest grade score was greater than the obtained value, he was considered as not meeting the criterion of one year below grade level.

The posttest usually was administered to students in May. Using grade level as a reference point, if a student achieved a posttest grade score which was equal to or greater than his grade level plus .8⁵, the student was considered achieving on or above his grade level. The aggregate

⁵For this analysis .8 was used as the expected normal growth during the school year based on national test norms.

statistics are shown in Appendix A.

Expenditures of Section 3 Program

A total expenditure of \$21,303,983.67 was reported to the Michigan Department of Education by 67 Section 3 school districts for school year 1971-72. Under the regular school year program \$12,712,225.98 or 59.7% was spent in salaries and inservice training; \$6,859,595.65 or 32.2% was spent in teaching materials; \$819,343.93 or 3.8% was spent on facilities; and \$912,818.11, or 4.3% was spent for administrative services. In addition, the 1972 summer session expenditure was \$463,419.74. The first report, A Description and Evaluation of Section 3 Programs in Michigan for School Year 1971-72, Report Number 1, was published in December, 1972.

The expenditure report of Detroit Public Schools was not available at that time. Therefore, the preliminary results of expenditures for Section 3 programs reported in Report Number 1 were based on 66 Section 3 school districts. Table 1 shows the tabulated values of the Section 3 expenditures from these school districts. The four main categories of expenditures are: teaching expenditures which include salaries for instruction and inservice training; materials; facilities and administrative services.

Table 2 shows the expenditures for all 67 Section 3 school districts, including Detroit. A comparison of the four main categories of expenditures under the regular school year between the state total (Table 2) and the state total excluding Detroit Public Schools (Table 1) shows that there is little change in the spending pattern under teacher expenditures, materials, facilities, and administrative services.

The changes in the 1972 summer school expenditures between the state total and the state total excluding Detroit are more marked, 80.0% vs. 52.7%

under teaching expenditures, 14.3% vs. 9.4% under materials, 0.3% vs. 0.5% under facilities and 5.2% vs. 37.6% under administrative services.

The tabulated values of the Section 3 expenditures from the Detroit School District are shown separately in Table 3. A comparison of the expenditures of the Detroit Public Schools and the remaining 66 Section 3 school districts revealed that under regular school programs, the spending patterns are similar. However, the summer school program shows that the Detroit Public Schools spent their funds for administrative services and the other 66 Section 3 school districts spent most of their funds for teaching expenditures. It should be noted, however, the summer expenditures in Detroit constituted approximately 1.3% of the total allocation of \$11,853,400.00 for that district. Figures 1 and 2 illustrate the spending patterns.

Summary

In this section an account and description of data collected on the school year 1971-72 Section 3 program was presented. Among the 112,500 Section 3 pupils, there were 94,083 with matched pre- and posttest scores.

The Detroit Public Schools provided matched test scores for 45,455 students, or 77% of their eligible students; the remaining 66 Section 3 school districts provided matched test scores for 48,628 students, or 91% of their eligible students.

The problem of "regression-to-the-mean effect" was taken into account by requiring the school districts to administer to their students a pre-test after the students were selected for participation in the Section 3 programs based on screening test scores.

On-site visits were made by the MDE staff to review selection procedures and pretest results. Workshops were conducted and guidelines were distributed

SUMMARY OF EXPENDITURES FOR SCHOOL YEAR 1971-72

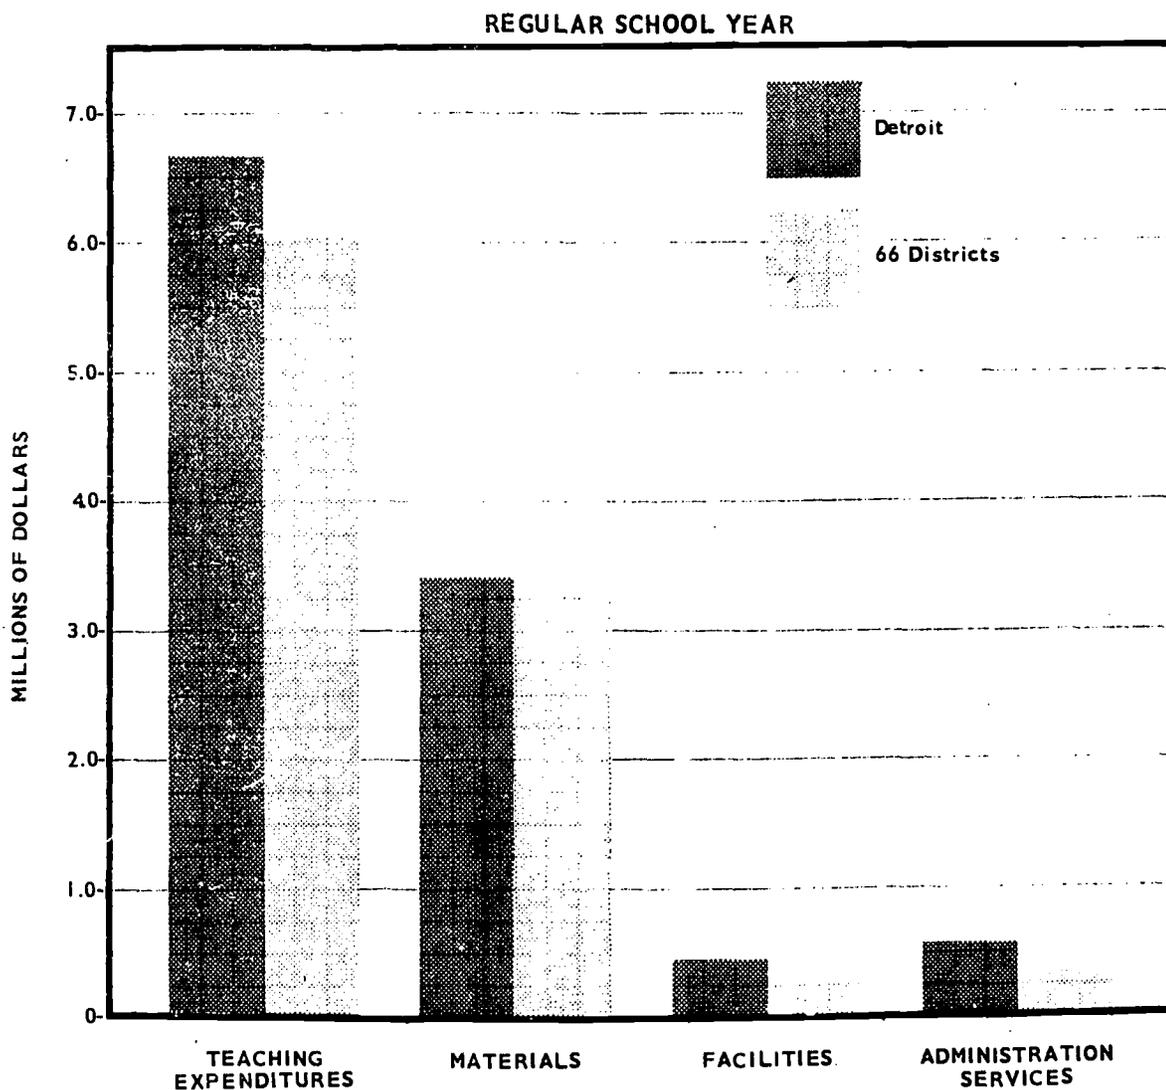

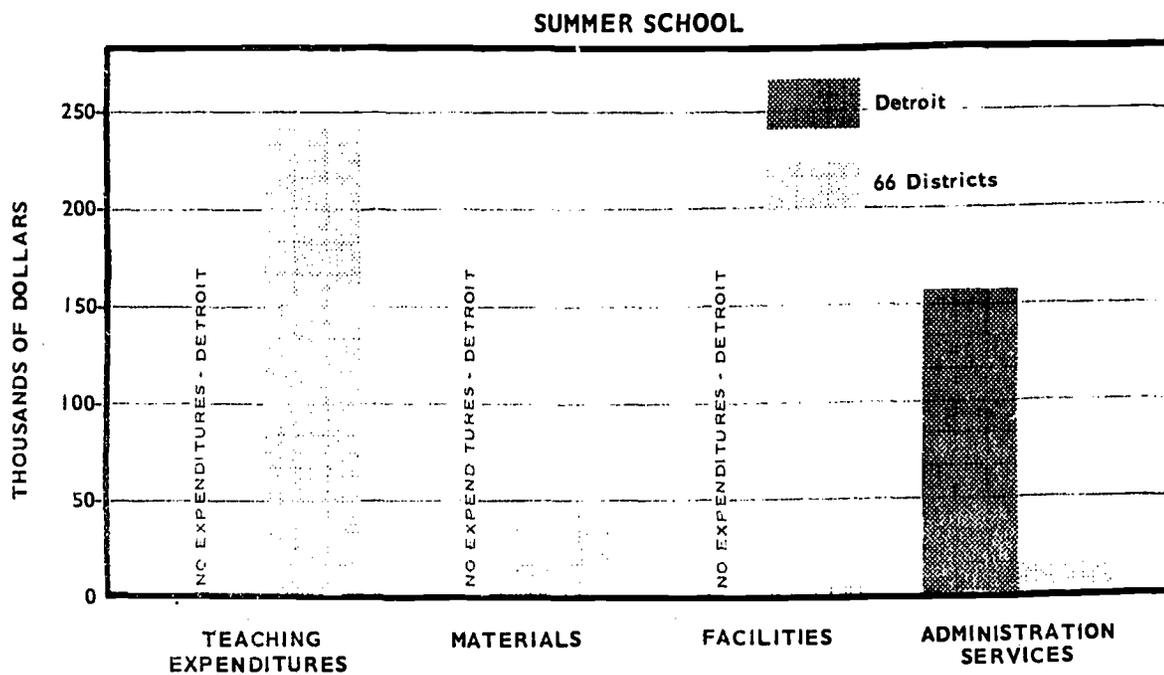

Figure 2

to facilitate the implementation of Section 3 programs.

The 1971 Michigan Educational Assessment Program scores served as an independent check on the Section 3 test scores of fourth grade pupils. The pre- and posttest scores of high and low achieving students were correlated. Generally the correlation coefficients were found to be high in some districts, mixed in some districts, and low in some districts.

The status of individual pupils pre- and posttest scores were checked. Although most students were low-achieving, some were not functioning at one or more years below grade level. In checking posttest scores, it was found that a relatively small number of students was performing at or above grade level.

The spending patterns of most Section 3 school districts were quite similar. Under regular school programs, school districts spend approximately 60% of their allocations on salaries for instruction and inservice training, approximately 30% of their allocations on materials, 3 to 5% on facilities and 4 to 5% on administrative services.

PART II

DESCRIPTION OF SECTION 3 STUDENT
ACHIEVEMENT IN READING AND ARITHMETIC

The difference between pre- and posttest reading and arithmetic achievement scores were computed to ascertain the levels of accomplishment. The criterion for success in accomplishment was established as one month gain in grade equivalent scores for each month in the program.

Number and Percent of Students Achieving at Various Levels of Accomplishment

The number and percent of students achieving at various levels of accomplishment were computed for each school and each district. Since the completion of the preliminary report, the master data tape has been updated several times and the percentage of accomplishment table has been modified and extended upward to include 300% and above instead of 100% and above as reported previously. As a result of these changes, the results of all 67 Section 3 school districts are presented in this report (Appendix B).

Summary figures as shown in Table 4 are: (1) all 67 Section 3 districts, (2) the 66 districts excluding Detroit, and (3) the Detroit public schools. From this summary table, it is clearly indicated that, if the school districts had been held fiscally accountable for 1971-72, Detroit would have received no funds in the school year 1972-73 for 7,452 of their students who made no gains or negative gains, and no funds for 13,812 students for whom no records or incomplete records were submitted to the Michigan Department of Education. In the remaining 66 school districts, the same figures are 7,221 pupils making no gains, plus 4,605 pupils for whom there are missing or incomplete records.

In the 66 school districts, among the students having matched pre- and posttest scores, 19.63% would have received prorated funding less than the \$200 per pupil funding level. The same figure for Detroit is 17.01%.

TABLE 4

SUMMARY OF PUPIL ACHIEVEMENT BY PERCENT OF ACCOMPLISHMENT FOR STATE TOTAL, STATE TOTAL EXCLUDING DETROIT AND DETROIT SCHOOLS

	112500			53233					

*Students receiving less than 150 days of instruction

Finally, Detroit would have received full funding for 30,271 pupils meeting or exceeding the 75% criterion. In the 66 other districts, full funding would have been provided for 31,865 pupils.

Section 3 Students Achieving a Minimum of 75% Accomplishment Level

Students participating in Section 3 programs were enrolled in one of three types of programs: (1) combined reading and arithmetic programs; (2) reading programs only; and (3) arithmetic programs only. The ranges of scores within a district across grades, as well as among districts, varied. The figures in Table 5 provide information on: (a) all 67 Section 3 school districts; (b) the state total without Detroit and (c) Detroit Public Schools. The tables show the range of percent of accomplishment under the three programs. Results for all 67 school districts are presented in Appendix C.

In Report Number 1, it was found that students in either the reading only or the arithmetic only programs performed better than those students in combined reading and arithmetic programs; and that students in arithmetic programs did better than students in reading programs. This same pattern holds true for the state total excluding Detroit Public Schools. The percent of students who met at least 75% of accomplishment in combined reading and arithmetic programs, reading only programs, and arithmetic only programs are 68.74%, 73.70% and 76.82% respectively. It should be noted that there was a small number of students in grades K-1 in the arithmetic only program.

In analyzing the 66 Section 3 school districts excluding Detroit by grade level, kindergarten and first grade students in reading only programs did better than their counterparts in combined reading and arithmetic programs and arithmetic only programs. Second grade students did relatively better in combined reading and arithmetic programs. Students in grades 3-6 performed better in arithmetic only programs than those in the two other programs.

In the Detroit Public Schools, there were only two programs: The combined reading and arithmetic program, and the reading only program. There was no difference in terms of accomplishment level for the two groups of students.

Thus, the overall pupil achievement pattern in Detroit is different from that of the 66 Section 3 school districts. The Detroit students in the combined reading and arithmetic program and the reading only program performed about the same. However, pupil achievement varied among different grade levels. Students in grades 1-3 did better in combined reading and arithmetic programs than in reading only programs. Students in grades 4-6 did better in the reading only programs than students in combined reading and arithmetic programs.

In the Detroit Public Schools, Section 3 kindergarten students were enrolled in the reading only program and were measured by the Detroit Reading Readiness Test. A minimum of at least ten raw score points must be achieved by each individual student to indicate one years growth. It was also agreed by the Michigan Department of Education administrators and the Detroit Public School officials that, irrespective of entry level, each student must achieve ten raw score points beyond a predetermined raw score point of 35 in order to meet the minimum criterion of success. In other words, if a student scored very low on the pretest, the district was required to bring the student to the predetermined raw score level of 35 plus the required ten raw score points from 35. About 70% of Detroit's kindergarten students achieved 75% of accomplishment level.

Table 6 shows the aggregate number of pupils: (1) achieving at the 75% and above level of accomplishment; (2) achieving at the 1% to 74% levels of accomplishment; (3) achieving at zero and negative levels; (4) pupils receiving less than 150 days of instruction and (5) pupils having missing data or no records. The statistics on individual school districts can be found in Appendix D.

TABLE 5.

Figures in Table 6 were based on usable student records submitted by school districts. In actuality there were 4,101 unaccounted for students in the 66 Section 3 school districts. In Detroit, the unaccounted for students came to 13,812. Taking into account the missing data problem, the percentages presented in Table 2 would be lower than the actual percentages. For example, the percent of pupils achieving at 75% and above accomplishment for the state total excluding Detroit, Detroit and the state total came to 53%, 51% and 55% respectively.

Comparisons of Means and Standard Deviations of Pretest and Posttest Scores by Grade Level

The reader versed in measurement will want to know the results of comparisons of means and standard deviations of pre- and posttest scores by grade for each building and district according to test name, battery and level. Appendix E provides the correlated t values for grades 3-6 which have at least 30 students. Pupils in each grade level within each school district frequently made statistically significant gains in reading and arithmetic achievement. In most cases, the increase in means was accompanied by a corresponding increase in standard deviations.

The district means in reading and arithmetic tend to be quite stable from year to year. Table 7 illustrates this phenomenon in the Lansing Public Schools.

Test results from two Section 3 school districts were used in an attempt to compare their Section 3 pupil growth in reading and arithmetic achievement relative to the district and national norms. In Table 8, the group means show that the Lansing District means are one to eight grade equivalent units lower than the national norms, and accordingly the Section 3 group means are two to fifteen grade equivalent units lower than the Lansing School District means.

TABLE 6

SUMMARY OF STUDENT ACHIEVEMENT

SCHOOL DISTRICT	State Total Excluding Detroit		Detroit		State Total	
	N	%	N	%	N	%
NUMBER OF SECTION 3 PUPILS	53233		59267		112500

 Grade 4 - Intermediate 1 Grades 5 & 6 - Intermediate

Thus, it can be established that, indeed, pupils enrolled in Section 3 programs have a prior history of low-achievement. Furthermore, the data presented in Table 8 illustrate the mean differences according to national norm, district norm, and Section 3 test results over a one year period. Clearly, Section 3 students, who had been low-achieving students in the past, did almost as well as the average students in Lansing Public Schools during the 1971-72 school year.

In order to illustrate that Section 3 students in Lansing Public Schools made better progress during school year 1971-72 than previous years, the fourth grade may be used as an example. In May 1971, the pretest was administered to those students while they were at the end of the third grade. The district average of all Lansing students showed that Lansing students in general were about six months behind the average third graders in the nation (3.2 vs. 3.8); at the same time Lansing's Section 3 students were one year and five months below the national average (2.3 vs. 3.8). Thus, Lansing Section 3 students were nine months behind the average Lansing students (2.3 vs. 3.2). It is evident that Section 3 students have not been making the same rate of progress compared with the national and Lansing district average rates of growth. However, during school year 1971-72, Section 3 students on the average achieved the same rate of progress as did the average Lansing students. If these Section 3 students could continue this rate of growth in subsequent years, the downward trend certainly could be stopped.

Tests results from Detroit Public Schools also were compared to Section 3 test results. The number of students in grades 1-6 tested by Detroit Public Schools was over 20,000 per grade level. These results for grades 1-6 can be found in Appendix E of this report. Table 9 shows that, over a six-month period, Detroit Section 3 students at all grade levels, with the exception of the first grade, made greater gains in reading and arithmetic achievement than the average students in their respective grades based on national norms.

Summary

According to the 1971-72 Detroit test results, 30,271 students made at least 75% accomplishment level; 7,732 students made gains above zero and below 75%; and 7,452 students made no gains or negative gains. In addition, there were 13,812 Detroit students for whom no records or incomplete records were submitted to the Michigan Department of Education.

In the 66 school districts excluding Detroit, 31,865 students made at least 75% of accomplishment; 9,542 students made gains below the 75% level and 7,221 made no gains. Missing data accounted for 4,605 students.

Comparisons of means revealed that students in grades 3-6 made statistically significant gains in reading and arithmetic achievement. Two school districts, namely, Lansing and Detroit, were used as specific examples. During school year 1971-72, Section 3 students on the average achieved at the same rate of progress as did the average Lansing students. Section 3 students in Detroit Public Schools made greater average gains in reading and arithmetic achievement than average gains made by all students in Detroit schools.

PART III

COMBINED RESULTS OF PROGRAM VARIABLES
ANALYSIS FOR ALL SECTION 3 SCHOOL DISTRICTS -
EXCLUDING DETROIT

Statistical analyses of test data and other demographic variables were undertaken to determine what influences program variables may have had on the achievement of Section 3 pupils. The program variables analyzed were: (1) type of program; (2) grade level; (3) funding level; (4) years of operation and (5) program duration. Only students in grades 3-6 were included in this analysis.⁶ The results of the analysis are presented below.

Means, F ratios and associated degrees of freedom are given in Appendix F of this report.

Type of Program

Although there are three program types (combined reading and arithmetic, reading only and arithmetic only) in Section 3 schools, most students were enrolled in combined reading and arithmetic (category 1) or reading only (category 2) programs. The number of cases falling under the arithmetic only (category 3) program was extremely small, therefore only categories one and two were used in this analysis.

The results of the analysis indicated that pupils in grades 3-6 in reading only programs made significantly greater gains in reading achievement than their counterparts in combined reading and arithmetic programs.

6. Although all 66 Section 3 school districts provided the Michigan Department of Education with data, due to errors in data reporting and problems associated with data processing, two school districts (Ferndale and Kalkaska) were dropped from the analysis.

Grade Level

The average growth gains in reading of all students in grades 3-6 were 7.8 months (grade 3); 8.3 months (grade 4); 8.9 months (grade 5); and 8.9 months (grade 6). The mean gain scores in arithmetic were higher: 8.9 months for third graders; 9.9 months for fourth graders; 9.4 months for fifth graders; and 9.7 months for sixth graders. There were significant differences in mean reading achievement scores across grades. However, no significant difference was found in pupil achievement across grades in the subject area of arithmetic. The grade level variable seemed to influence gain scores in the area of reading, but not in arithmetic.

Funding Level

Three funding levels were investigated: (1) funding level 1 - schools which received Section 3 money only; (2) funding level 2 - schools which received Section 3 and Title I ESEA money and (3) funding level 3 - schools which received more than two sources of funding; Section 3, Title I and other sources of funding.⁷ There were no differences in mean reading achievement among the three funding levels in pretesting. However, there was a highly significant difference in mean reading achievement when the reading mean gain scores were analyzed according to funding level. The mean gain scores for the three funding levels were 8.2 months for funding level 1; 8.5 months for funding level 2 and 5.3 months for funding level 3.

In the subject area of arithmetic, again there were no differences in pretest means, but the mean differences of the average gain scores were found to be significantly different. The mean gain for the three levels is 8.9 months, 10.3 months and 6.7 months.

7. A fourth funding level resulted from the fact that a large number of schools failed to report the information needed to set funding levels.

Years of Operation

The number of years that a given school building has been receiving Section 3 money in each school district varied from one to four.⁸ The great majority of schools reported school year 1971-72 as the first year of operation for Section 3 programs. Evidence seemed to indicate the pupil achievement in combined reading and arithmetic increased with the number of years of Section 3 program operation. This pattern is fairly consistent if the fourth category (years of operation = 4) is deleted.⁹

Since there were no significant differences in reading and arithmetic achievement by years of operation on the pretest results, the significant differences found in mean differences of pre- and posttest results could be attributed to treatment effect and possible factors other than years of operation, for example, the accountability element implemented under the school year 1971-72 Section 3 programs.

Program Duration

Program duration means the elapsed time between pre- and posttest administration. It ranged from 6 to 8 months which resulted in three types of program duration, i.e., 6 months, 7 months, and 8 months. There was no difference in mean reading achievement gains under the three types of program duration. There was a highly significant difference in the arithmetic achievement. The mean gain in arithmetic scores was 8.9 months for the 6 month programs, 10.2 month for the 7 month programs, and 8.8 month for the 8 month programs.

Except for the fact that pupils made higher gains in the 7 month programs, there was no consistent direction concerning the effect of program duration :

⁸ Some school districts received money under the previous Michigan Compensatory Education Program.

⁹ A large number of schools failed to report years of operation for Section 3 programs.

on pupil achievement.

In addition the mean differences of the pre- and posttest scores of a number of comparable school districts using the May to May testing vs. the September to May testing were compared. No consistent direction favoring either method of testing was found among the school districts. This will be pursued further using larger sample size and other measures of control for the 1972-73 Chapter 3 evaluation report.

Summary

In this section, pupil achievement in all Section 3 school districts - excluding Detroit -- as it relates to type of program, grade level, funding level, year of operation and program duration was presented.

The results showed that students in reading only programs made greater gains in reading than those students enrolled in combined reading and arithmetic programs.

There was a statistical significant difference in means across grades in reading, but not in the area of arithmetic.

There were significant differences in mean gains across funding levels in combined reading and arithmetic achievement. However, there was no conclusive evidence indicating that an increased funding level would result in higher pupil achievement.

Years of Section 3 program operation varied from one to four, and evidence seemed to indicate that pupil achievement in combined reading and arithmetic increased with the number of years of program operation.

Program duration ranged from 6 to 8 months. While no difference was found in mean reading achievement gains according to program duration, there was a highly significant difference in the arithmetic achievement. Students in the seven month programs made higher gains in arithmetic achievement.

PART IV

RESULTS OF PROGRAM VARIABLES ANALYSIS
FOR THE DETROIT PUBLIC SCHOOLS

There are 234 Section 3 schools in Detroit Public Schools, distributed in 8 regions. Detroit Public School officials reported that there was no central coordination of Section 3 programs; principals generally enjoyed complete autonomy. Furthermore, programs underwent constant changes, from school year to school year.

Due to the large number of schools involved and diversity of programs, the Department of Education staff and the Detroit Public School administrators currently are exploring ways to identify promising programs. The Detroit Public Schools have evaluated a number of identified projects within the district and found little consistent pattern in terms of program effectiveness relating to pupil achievement. A total of 24 schools were identified by Section 3 staff in Detroit, 12 top performing schools (growth of two years and above) and 12 schools with the lowest mean gains (1/2 year and below).

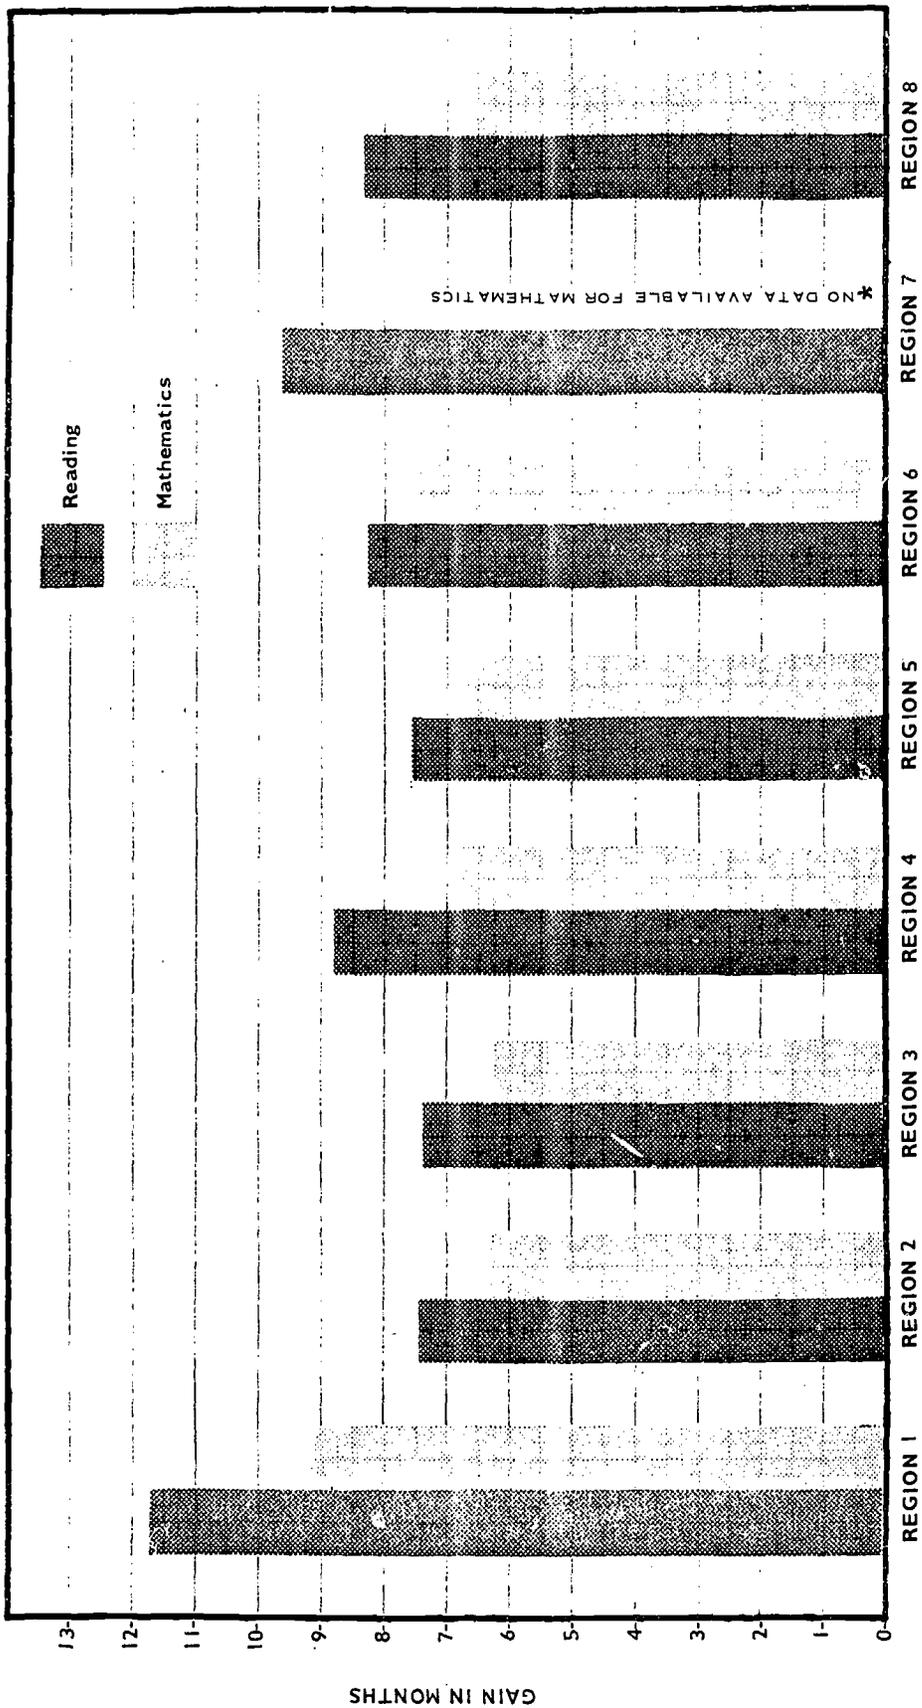

A graphic presentation (Figure 3) shows that, over one academic year, the range of achievement among the regions ran from a gain of 7.4 months to 12.2 months in reading and 6.3 months to 9.2 months in arithmetic.

The Detroit Public Schools used the Paragraph Meaning subtest of the Stanford Achievement Test for the measurement of pupil reading, and the Mathematics Concepts and Mathematic Problem Solving subtests of the Iowa Test of Basic Skills for the measurement of pupil arithmetic achievement.

Type of Program

The reading achievement gains of Detroit Section 3 students in grades

FIGURE 3

REGIONS IN THE DETROIT PUBLIC SCHOOL SYSTEM

* Note: Region 7 Schools did not operate a mathematics program in 1971-72.

3-6 enrolled in the combined reading and arithmetic programs or the reading only programs were not found to be statistically significant.

Grade Level

A careful examination of the pretest reading achievement of Detroit Section 3 students across grades 3-6 revealed that the third graders on the average were eight months below the national norm, the fourth grade students were 11 months below the national norm, the fifth grade students 15 months below, and the sixth grade students 17 months below. It should be noted that students in all four grade levels made eight or nine month gains in reading; in other words, they all made better progress in reading than they had been doing in previous years, but were still below their grade level. There was no significant difference in reading achievement when the reading gain scores were compared across grades.

In the subject area of arithmetic, the pretest arithmetic achievement scores revealed that students in the third grade, on the average, were 7 months below the national average, the fourth graders were 9 months below grade average, the fifth graders were 11 months below grade average, and the sixth graders were 14 months below grade average. Again it was found students performed uniformly across grades. On the average, students made between seven and eight month gains across the four grade levels.

Funding Level

The great majority of Detroit schools reported funding level data; that is, building programs funded from Section 3 only (funding level 1), from both Section 3 and ESEA Title I (funding level 2), and from Section 3, Title I and other sources (funding level 3). Pretest pupil achievement in reading did not reveal any significant differences in means among

the three funding levels. However, the reading gain scores under the various funding levels were found to be highly significant. Students in funding level three made a gain of 10 months in reading; those in funding level two made nine months gain and eight months gain was made by those in funding level one. In other words, evidence indicated that in Detroit, funding level did make a difference in pupil achievement.

In the subject area of arithmetic, pupils in the three funding levels seemed to perform equally well.

Years of Operation

All Section 3 schools in Detroit reported school year 1971-72 as the first year of program operation, therefore no analysis was made under years of operation.¹⁰

Program Duration

Detroit students were mostly in the six months Section 3 program, with a small number of students in the seven months program. The former group performed better in pretesting than the latter group. However, an analysis of the reading gain scores reversed the trend.

In the subject area of arithmetic, students in each program (i.e., six months and seven months duration) performed about the same on the pretest. However, analysis of the arithmetic gain scores between the two groups revealed a highly significant difference in pupil performance favoring the seven months program.

Summary

In the Detroit Public Schools, Section 3 students enrolled in the

10. Detroit Public Schools had received money under the previous Michigan Compensatory Education Program.

combined reading and arithmetic programs or reading only programs were not found to be different in reading achievement.

There was no difference in reading and arithmetic achievement gains across grade levels.

When funding level was analyzed, students made greater gains in reading with increased funding level.

The results also showed that Detroit students in the seven month programs made greater gains in reading and arithmetic than those in the six month programs.

PART V

COMPARISON STUDY OF HIGH ACHIEVING AND LOW ACHIEVING SCHOOL DISTRICTS

A comparison was made between the ten school districts with large percentages of students achieving at the 175% and above levels of accomplishment and the ten school districts with large percentages of students achieving at the 50% and below levels of accomplishment.

The high and low school districts shown in Figures 4 and 5 were selected based on one criterion, namely percent of accomplishment by rank order.

A comparison of the instructional process of the high and low achieving districts was hampered by the lack of quantified data and anecdotal records. On-site visits by Michigan Department of Education staff and local Section 3 project people often revealed the protean nature of various programs within the districts. The "Hawthorne effect" often can cloud the objectivity of the observation.

In making the high/low comparison, four general program components were considered:

1. Program logistics -- considered the extent of time commitment, the size of the learning unit (or pupil/teacher ratio), and the degree to which the program functioned as an assimilated (a part of the regular classroom process) versus an extraneous instructional unit.
2. Program personnel -- considered the intensity of "people resources" committed to the pupil or instructional unit, as well as what kind of resource, i.e., teacher aides, reading specialists, auxiliary teachers, consultants, coordinators, and university consultation.

FIGURE 4

PERCENTAGE OF STUDENTS WITH A PERCENT OF ACCOMPLISHMENT OF 175% AND ABOVE

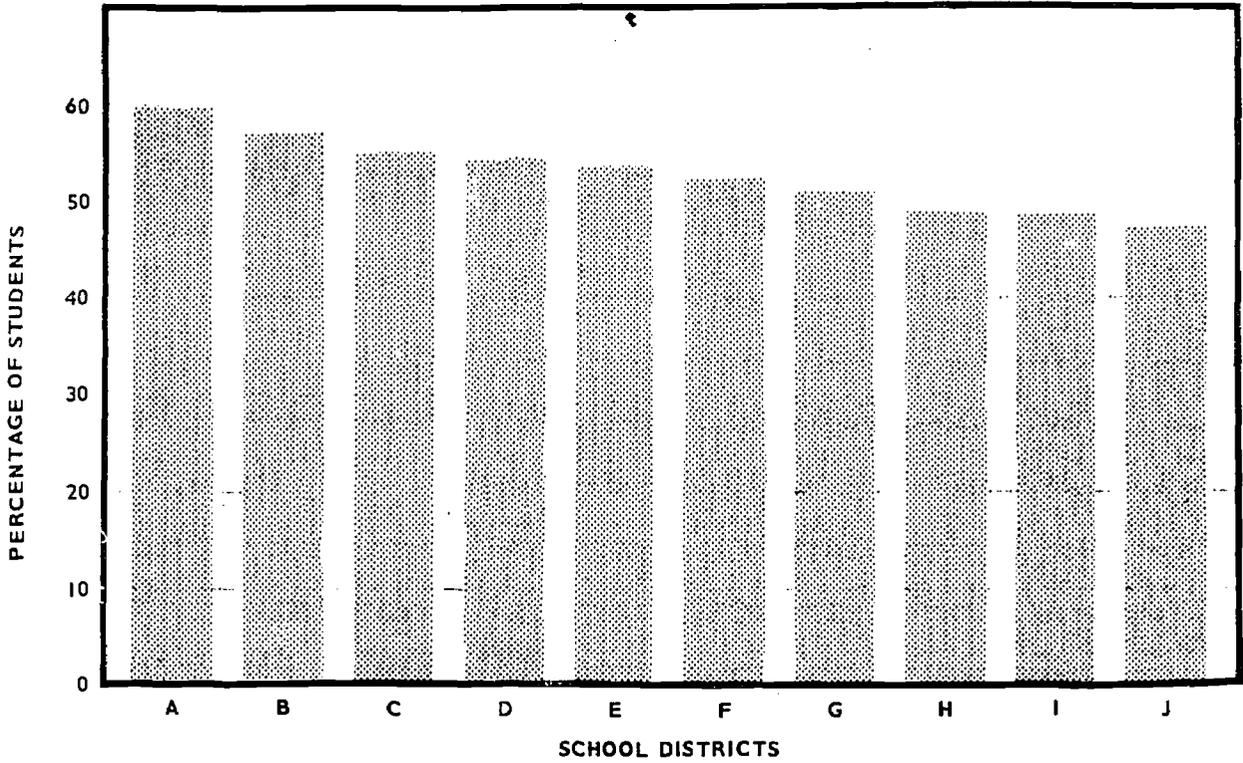

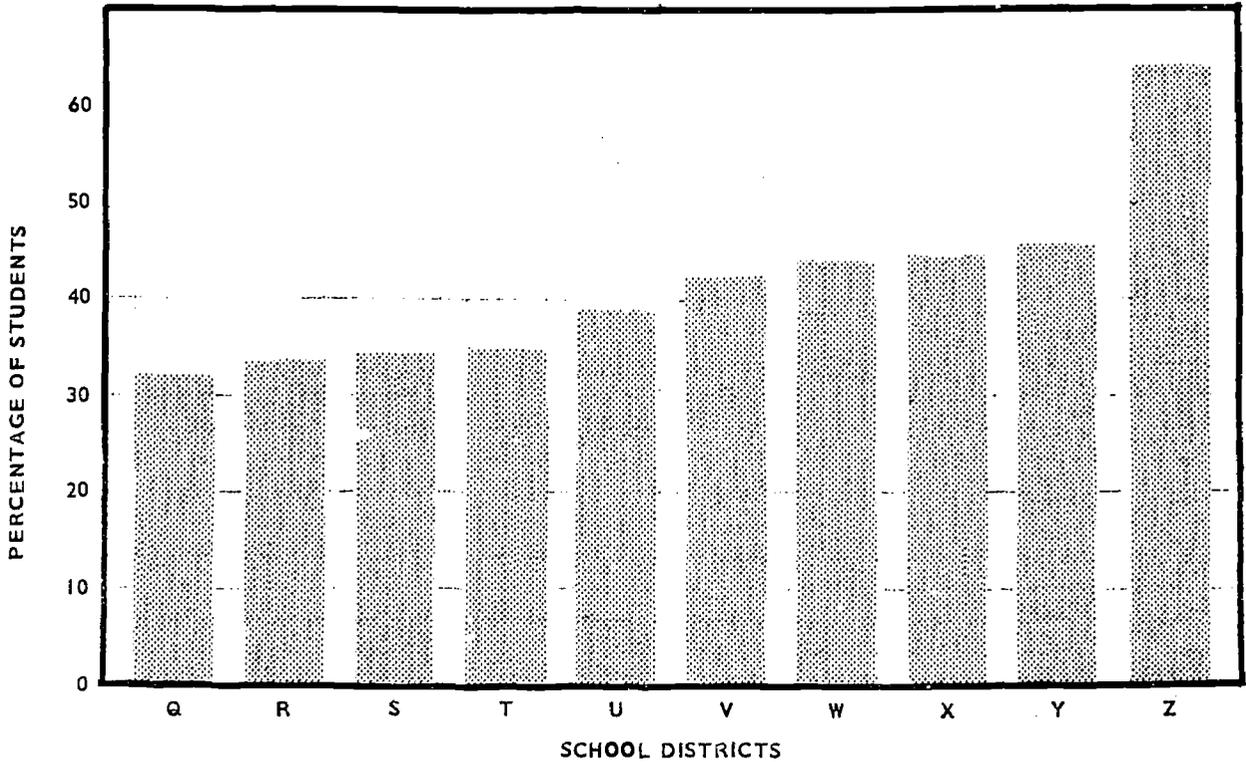

FIGURE 5

PERCENTAGE OF STUDENTS WITH A PERCENT OF ACCOMPLISHMENT OF 50% AND BELOW

3. Instructional materials -- considered what kinds of instructional resources were utilized by the program, i.e., multimedia, programmed materials, visual aids, a learning resource center, etc.
4. Instructional process -- assessed what kind of instructional process was utilized by the program, e.g., individualized instruction and assessed the extent of systematic interaction of the process components and people, i.e., diagnostic screening, assessment of pupil's deficiencies and learning styles, program prescription and feedback (evaluation and reinforcement).

Program Logistics

The amount of instructional time committed per week appeared to be equivalent between the high and low achieving districts. However, there appears to be more of a tendency for high achieving districts to utilize extraneous small groups instead of assimilating the program into the regular classroom instruction.

Program Personnel

The high achieving districts tended to utilize coordinators or consultants to facilitate coordination and inservice training for the teachers. The low achieving districts tended more toward parallel personnel, i.e., remedial or auxiliary teachers, rather than supervisory personnel. Both groups utilized teacher aides.

Instructional Materials

Several districts in both groups mentioned utilizing learning resource

centers. All districts utilized various multi-media, programmed materials, etc.

Instructional Process

Nearly all districts recognized the need to relate instructional materials to student deficiencies or disabilities as stated in program descriptions. More high achieving districts mentioned the role of a student learning style in planning the pupil's instructional program. While the high achieving districts made more frequent reference to diagnostic screening, most of the districts were utilizing some form of individualized instruction.

While both groups mentioned the role of feedback for evaluation and reinforcement, more high achieving districts acknowledged this component and emphasized the role of reinforcement (reward/praise).

Problems with the Quantification of Program Descriptions

The program descriptions were obtained from the 1971-72 Section 3 program applications. The instrument used to obtain program descriptions contained only two general categories -- organizational characteristics and instructional strategies. These were essentially open-ended response formats. Such a format presents great difficulties for data interpretation in that omission of program components can easily occur.

The second major problem in attempting to quantify the program descriptions was the use of educational concepts in broadly stated terms. The following are commonly used concepts whose exact meaning would seem to be in question due to generalized usage.

1. Learning centers -- what population uses the center, a classroom, an entire school? What kinds of resources, interest and ability levels are included in the resources? Is this comparable to a

library, a lab, self-study?

2. Programmed materials -- does this mean a precise, sequential and objective instructional format related to the learning deficiencies of pupils?
3. Learning style -- to expect definitive information on this concept may be an unreasonable demand since districts were not asked this question specifically. However, it may be a potential key to differentiating how effectively teachers and districts are dealing with various learning processes.

Percentage of Section 3 Monies Expended

Although each of the Section 3 school districts was not required to submit a budget at the beginning of the year, all Section 3 school districts submitted a summary expenditure report at the end of the school year 1971-72. Since districts had complete autonomy in the expenditure of funds, it is assumed that the summary expenditure reports accurately reflect monies expended.

The itemized expenditures of the high achieving and low achieving districts are presented in Tables 10 and 11.

It appeared that the high achieving and low achieving districts spent the Section 3 funds in a similar fashion. That is, approximately 50% in salaries for instruction, 15% to 20% in teaching supplies and other instructional equipment, and 10% to 15% in instructional equipment. However, there are some differences between the two groups; the high achieving group tended to spend relatively less in salaries for instruction, textbooks and instructional equipment, and more in the areas of administration, supplementary materials and school libraries.

One school district in the high achieving group showed a completely

different pattern of spending from the rest of the population; it spent 71.05% of its total allocation on construction and non-instructional equipment and 19.60% on supplementary materials. Another school district submitted an incomplete financial report. Aside from these two exceptions, spending patterns were closely matched between the high achieving and low achieving groups of districts.

Summary

Comparing the high and low achieving districts, there is great similarity between concepts and processes utilized. The differences between groups must derive from the specific operations veiled behind the general concepts stated by the districts. For example, the written descriptions give the general impression of equivalence of process, i.e., use of individualized instruction, use of programmed materials, etc. However, the high achieving districts seemed more structured and more organized in relating student's deficiencies and learning styles to program prescriptions (or programmed materials), and then following up with pupil/teacher consultation for feedback, i.e., evaluation and reward. Both groups may be equivalent on this process, but the high achieving districts seemed to stress the specific pupil deficiencies.

In contrast, some of the low achieving districts were more ambiguous in meeting student learning deficiencies. Their strategy sounded more hit-or-miss, i.e., "we're using a variety of supplemental texts, materials, media, etc." Such an approach would appear less geared to dealing with learning deficiencies than structured and sequential programmed materials. Assuming that reading and arithmetic are structured systems, then presumably deficiencies in learning these systems could best be met by utilizing

a structured, systematic program or materials. Thus while more intangible program components were mentioned, e.g., much love and understanding, or emphasis on materials relating to individual interest, these aspects seem more related to student receptivity, and may not move beyond to meeting and countering specific deficiencies.

The itemized expenditures of the high and low districts revealed that the spending patterns were quite similar. It appears that the manner in which the funds were spent -- at least in terms of the expenditure categories utilized in this report -- may not have direct impact on pupil achievement.

PART VI

DISCUSSION AND RECOMMENDATIONS

Description of Data Collected

During school year 1971-72, the 67 Section 3 school districts were funded for a total of 112,500 pupils. The schools submitted 101,198 pupil records; there were 94,083 students, or 93% with matched pre- and posttest scores.

The problem of "regression-to-the-mean" was taken into account by requiring that students be given a pretest after they were selected for participation in the programs based on achievement test results.

Recommendation Number 1

It is recommended that in the future the quartile range be charted in order to compare the percentages of students in each quartile on their pre- and posttest scores. This can be performed on the building, region or district level for any grade level. A study of this nature may reveal how various programs affect the high, middle and low achieving students. In addition, the statistical phenomenon of regression-to-the-mean should be investigated. In order to answer the question whether students with low pretest scores gained more than students with high test scores, each grade within each district can be divided into thirds based on their pretest, and gains can be computed for each of the subgroups.

It is predicted that the problems of missing data and unaccounted students will not be completely eliminated for the second year of the program. However, due to a number of preaudit and audit procedures established to facilitate the update of information sent in by school districts, these problems are expected to be reduced considerably in magnitude. In addition, procedures were set up to check the accuracy of test scores. Most important of all, emphasis must be given by local school districts to following carefully the instructions prepared by the

Michigan Department of Education and to checking data thoroughly before submitting it to the Department.

Discounting the large number of unaccounted students in Detroit, Beecher, Pontiac, Saginaw, Flint and Willow Run, the data were considered representative of the 740 participating elementary school buildings in the 67 Section 3 school districts.

Recommendation Number 2

It is recommended that school districts establish some kind of system to facilitate the validating and checking of test results either based on individual classrooms or buildings. In addition, the relevancy of tests used should be carefully scrutinized by the districts. Both internal and external checks on test scores should be performed to insure the accuracy and validity of the data.

It is difficult for the school districts to engage an outside agency to audit results. In addition, it is also a sensitive issue, for apparently, not too many administrators are willing to follow through with this process. However, this is an important and necessary step in implementing accountability in the schools. An alternative route should be considered. In some school districts all students are tested under district testing in the fall, however, only certain students are tested in May (e.g., students in Section 3, Title I ESEA programs). It is highly desirable that districts test the students under similar test conditions for both pre- and posttesting.

Under the present set of Section 3 rules, it is possible for some students to be tested in May-June of each year. The posttest scores of school year 1971-72 can be used as the pretest scores of school year 1972-73, provided that the identical or parallel form of the test be administered to the students in May, 1973.

The status of pre- and posttest pupil achievement was presented. In some districts, some students were found to be performing on or above grade level upon posttesting. The question here is not only that these students should be studied, but also whether these students should be removed from the Section 3 program and thus make room for those students who do not perform to grade level. If they were locked in the program for the entire three year cycle, then, it would be illuminating to do a follow-up study on these students. In addition, there is a real need for process evaluation on the local district level.

Recommendation Number 3

Within each school district, evaluators should study the delivery system of those buildings in which large numbers of students were found to make one, two or more years gain in achievement over a one year period, and those who failed to make gains.

The spending patterns of most Section 3 school districts were found to be quite similar; 60% of their allocations was spent on salaries for instruction and in-service training, approximately 30% of the money was spent on materials, 3-5% on facilities and 4-5% on administrative services. The "1972-73 Budget and Staff for Section 3 Program" will yield essentially the same kinds of information. However, the form was modified so that school districts were also required to provide information on Section 3 staff in terms of full time equivalency to the nearest whole number. In other words, in the 1972-73 evaluation report, it will be possible to provide answers to questions pertaining to the number of additional staff hired with Section 3 money.

Recommendation Number: 4

In order to obtain more meaningful information and do a creditable job in analyzing financial data, it is recommended that school districts, particularly the larger ones, file their summary expenditure reports on the building level in the future.

Description of Section 3 Students Achievement in Reading and Arithmetic

It is conservatively estimated that in Detroit Public Schools missing data accounted for over 20% of their students. In the remaining 66 school districts, missing data accounted for 10% of the total population. The Michigan Department of Education, Section 3 evaluation staff has set up procedures and is working vigorously toward the elimination of the missing data problem, thus reducing the number of students who will receive no Section 3 money for the third year of the program for reasons other than achievement. It is hoped that local education agencies will share this responsibility. These figures should also provide food for thought about alternative uses of the "surplus" money which invariably will accrue in school year 1972-73.

The distribution of pupil achievement ranged from zero and below to 300% and above accomplishment level. In the combined reading and arithmetic programs, approximately 69% of the students in the 66 Section 3 school districts excluding the Detroit Public Schools met at least 75% of accomplishment level. One hundred percent accomplishment level means one month gain in reading and arithmetic for each month in the program. Approximately 74% of Section 3 students enrolled in reading only programs met at least 75% of accomplishment level; and 77% of the students enrolled in arithmetic only programs met this goal.

In the Detroit Public Schools, approximately 66% of their Section 3 students achieved at least 75% of accomplishment levels in the combined reading and arithmetic programs and reading only programs.

Since school districts would not receive a bonus if the gains were above 75%, there is a priori reason to believe that students achieving above the 75% level of accomplishment were gains actually made by the

students. Therefore, it would be revealing to study why these supposedly low achieving students were able to make spectacular gains. A follow-up study on these high achieving students for the second and third years of the program is necessary to ascertain the retention power.

Comparison of means showed that students in grades 3-6 made statistically significant gains in reading and arithmetic achievement. Lansing Public Schools and the Detroit Public Schools provided district test results for analysis on the district level. During school year 1971-72, Section 3 students on the average achieved at the same rate of progress as did the average Lansing students. Section 3 students in the Detroit Public Schools made greater average gains in reading and arithmetic achievement than the average gains made by average Detroit students. Further analysis is recommended in order to compare the performance of Section 3 students with other students not in the Section 3 programs. It should be noted that there are no comparison groups (control groups) within each school district, since Section 3 students comprised the lowest achieving students in each school district distributed across grades K through 6 in all elementary school buildings.

Combined Results on All 67 Section 3 School Districts

Pupil achievement as it relates to type of program, grade level, funding level, years of operation, and program duration in the 66 Section 3 school districts, as well as in the Detroit Public Schools, were presented. It can probably be assumed that most of the Section 3 students in the 67 school districts are in combined reading and arithmetic programs in the school year 1972-73.

Section 3 school districts will undoubtedly provide more complete information on funding level and years of service in the future. Furthermore, additional information on summer school programs, program duration and program description will probably shed more light on the Section 3 programs of the school year 1972-73.

High and Low Achieving School Districts

There was great similarity between concepts and process utilized when the high and low achieving school districts were identified and studied. The high and low achieving districts were selected according to one criterion, that is, pupil achievement. Problems encountered in the analysis of program components, derived from program descriptions submitted by the school districts, were numerous. The financial reports submitted by school districts did not shed much light in terms of its impact on program effectiveness.

Recommendation Number 5

In order to ascertain what caused the improvement or failure of pupil achievement, the planned educational delivery systems, the relationship between costs and the delivery systems should be carefully studied.

Needless to say, process evaluation should be a paramount concern of local school districts. Evaluation should not be confined to the identification of successful and unsuccessful buildings based solely on the criterion of achievement, but also the conditions under which they operate. In order to facilitate process evaluation, quantitative and anecdotal records must be kept on the class and/or building level.

APPENDIX A

Number of Students Achieving Less Than One
Year Below Grade Level on the Pretest Grade
Scores and Number of Students Scoring on or
Above Grade Level on the Posttest

Pages 62 Through 65

APPENDIX F

One Way Classification Analysis of
Variance -- Summary of "F" Ratios

Pages 123 Through 129

Appendix F

One way classification analysis of Variance

Type of Program (Reading & Arithmetic Programs & Reading only Programs)	66 School Districts		Detroit Public Schools	
	F	df	F	df
Grade Levels (3-6 Grades)	15.22**	1/1985	0.71	1/783
Reading Arithmetic	2.62*	3/1983	2.16	3/781
	1.38	3/1645	0.61	3/377
Funding Level (1,2,3, & blank)	9.38**	3/1983	5.37**	3/781
Reading Arithmetic	14.48**	3/1645	6.27**	3/377
Years of Operation (1-4 Years)	5.49**	4/1982	NA	NA
Reading Arithmetic	9.29**	4/1644	NA	NA
Program Duration (6-8 months)	0.72**	3/1983	7.69	1/783
(6-7 months - Detroit only)	4.95**	3/1645	36.98	1/379
